DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

4. Claims 1-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 4,219,529 to Tersteeg et al in view of US Patent 4,363,245 to Schmid.

Tersteeg et al disclose an incubator for use with a chemical analyzer of the type where

Art Unit: 1743

fluid is metered onto a test slide which is analyzed after a suitable period of incubation. The incubator comprises means which defines a temperature controlled chamber having a first location for wherein slides are transferred into the chamber and second location wherein slides are transferred out of the chamber. The device also comprises a rotor means and a drive means. The rotor means moves the slides about an axis generally parallel to the direction of the slide movement into and out of the chamber. A housing is also provided, as well as a circular conveyor for moving the slides through the rotary path. An inside rotary wheel for nesting washing and reading vessels is provided. An outside rotary wheel for incubation and storage of vessels.

Tersteeg et al differ from the instant invention in that there is no disclosure of first and second spur gears.

Schmid teaches a sampling apparatus having a control motor, an output shaft and first and second spur gears. The first and second spur gears are drivingly engaged with the output shaft. Schmid teaches that the first and second spur gears allows rotation of a primary housing along with rotation of a subhousing. It would have been obvious, to one of ordinary skill in the art to use first and second spur gears in the device of Tersteeg et al to allow a first set of slides to be rotated around a second set of slide and the simultaneous analysis of both sets of slides.
